

VERDE Restaurant System v1.0.7

Customer Welcome, Installation & License Activation Guide

Commercial Release: v1.0.7 | Package: VERDE-COMMERCIAL-RELEASE-v1.0.7.zip

1. What You Receive

- VERDE Restaurant System v1.0.7 commercial software.
- 17 official VERDE plugins.
- Installation / Quick Start documentation.
- License information and authorized download access supplied after purchase.
- Authorized update access according to the purchased license terms.

2. Important Package Notes

- The commercial v1.0.7 package contains exactly 17 official VERDE plugins.
- License Manager is not bundled inside the 17-plugin restaurant ZIP; it is part of the separate licensing/update infrastructure.
- Customer Order Status development patches, SQL dumps, nested ZIP packages, legacy demo catalog data, logs, and development packages are not part of the commercial release.
- A fresh installation starts with an empty restaurant catalog. Create the restaurant's own menu after installation.

3. System Preparation

- Use a working WordPress installation.
- Use HTTPS for production and customer QR ordering.
- Have WordPress Administrator access.
- Set the WordPress timezone to the restaurant's local timezone.
- Use a clean WordPress installation for the first installation when possible.
- Create a full website/database backup before future updates.

4. Install VERDE v1.0.7

- Log in to WordPress Administrator.
- Go to Plugins → Add New → Upload Plugin.
- Upload VERDE-COMMERCIAL-RELEASE-v1.0.7.zip.
- Install the package.
- Activate the 17 official VERDE plugins included in the package.
- Do not install development patches or the Customer Order Status development patch.

5. Recommended First Setup

- Confirm the WordPress timezone.
- Configure staff and roles.
- Configure restaurant tables and table sessions.
- Configure Table Security / Table QR when required.
- Create the restaurant menu in VERDE Menu Management.

- Create inventory ingredients.
- Create recipes for menu items when Inventory is used.
- Configure Reception.
- Configure Kitchen / Waiter workflow.
- Configure Payment.
- Configure Daily Closing.

6. Create the First Menu

- Open VERDE → Menu Management.
- Create the restaurant's menu item, including its name, category, price and other available fields.
- Save the menu item.
- Menu Management is the source of truth for menu data.
- Available menu items can be used by Customer Order and referenced by Inventory Recipes.

7. License Activation

- Confirm WordPress, HTTPS, VERDE plugins and the intended licensed domain are ready.
- Install the authorized License Manager component supplied according to the commercial instructions.
- Open the VERDE License Manager page.
- Enter the license information supplied with the purchase.
- Submit activation to the production VERDE License Server.
- Confirm that the license is shown as ACTIVE.
- Do not share the license key publicly.
- Do not activate the license on an unintended production domain.

8. Restaurant Workflow Test

- Open a valid table session.
- Place a customer order.
- Normal commercial order lifecycle: WAITING → CONFIRMED → COOKING → DELIVERED → COMPLETED.
- Process payment.
- Close the table.
- Run Daily Closing after the operational test.

9. Updates

- Licensed customers may receive authorized updates when an eligible update is available.
- Before an update: back up the website and database, record installed VERDE versions, verify license/update eligibility, read the target release notes, then apply the authorized update.
- After updating, verify plugin versions and test the restaurant workflow.
- Do not install development patches as production updates unless they are explicitly part of an official release.

10. Support

- For a suspected bug, provide the VERDE version, WordPress version, PHP version, affected domain, user role, exact reproduction steps, exact error message, and screenshots where useful.
- Never send passwords, private license keys, or secret credentials.

- Support is intended for supported configurations; third-party plugin conflicts, hosting/firewall/WAF issues, unsupported versions, or custom code may require separate investigation.

Commercial baseline: v1.0.7 is the frozen commercial release. Future source changes should use a new version number.
